The first model for the distribution of ions near the surface of a metal electrode was devised by Helmholtz in 1874. He envisaged two parallel sheets of charges of opposite sign located one on the metal surface and the other on the solution side, a few nanometers away, exactly as in the case of a parallel plate capacitor.

This effectively creates two capacitors that are series-connected by the electrolyte. Voltage persists after the switch is opened—energy has been stored. In this state, solvated ions in the electrolyte are attracted to the solid surface by an equal but opposite charge in the solid.

Supercapacitors, also known as the electrochemical capacitors or ultra-capacitors, have attained huge attention and recognition due to their outstanding characteristics such as the high specific power (500-10,000 W/kg), exceptional charge/ discharge performance and the tendency for a longer lifetime (>500,000 cycles) .

Electrochemical capacitors (ECs), variously referred to by manufacturers in promotional literature as "supercapacitors" or "ultracapacitors," store electrical charge in an electric double layer at the interface between a high-surface-area carbon electrode and a liquid electrolyte. 1,2 Consequently, they are also quite properly referred to as electric double layer capacitors.

Unlike batteries, electrochemical capacitors (ECs) can operate at high charge and discharge rates over an almost unlimited number of cycles and enable energy recovery in heavier-duty systems. Like all capacitors, ECs (also called supercapacitors or ultracapacitors because of their extraordinarily high capacitance density) physically store charge.

Electrochemical capacitors (ECs) 1 represent a burgeoning and diverse class of energy-storage technologies that promise to bridge the performance gap between high-power capacitors and high energy-density batteries. Although commercialized ECs have been available since in the 1960s, interest from the broader scientific community (as gauged by trends in publication; Fig. 1), has rapidly expanded ...
