Performance Analysis In this section, we describe the essential performance analysis measures to make sure that the interconnection architecture is meeting the performance requirements of the system. Performance analysis consists of measuring the bandwidth at each initiator thread, worst case and average latency of the CPU, and the area overhead to achieve the bandwidth and latency.

The single mesh radio, marked AH, provides both services - client access and backhaul. The comparative performance analysis to follow indicates this architecture provides the worst services of all the options , as expected- both backhaul and service compete for bandwidth. 2. Dual-Radio with a 1-Radio backhaul mesh.

### Performance Analysis of Three Competing Mesh Network ...

ABSTRACTThis work presents an in-depth analysis of the majority of the deep neural networks (DNNs) proposed in the state of the art for image recognition. For each DNN multiple performance indices are observed, such as recognition accuracy, model complexity, computational complexity, memory usage, and inference time.
